

BARAM

Your agent works for you. Baram proves it.

The AI Compliance Settlement Layer on Nasun Network

BARAM.NASUN.IO

AI Agents Act Without Accountability

- Did it actually run what it claimed?
- Did it stay within the budget I set?
- Can I prove, to anyone, what the agent did?
- **No AI provider** – OpenAI, Anthropic, Google, offers a per-inference, tamper-proof audit record.

Two Regulatory Deadlines One Empty Market

No crypto-native AI compliance protocol exists.

No crypto-native AI compliance protocol exists. Two deadlines are converging on a gap nobody has filled.

EU AI Act — Enforcement August 2026. Mandatory audit trails. Fines up to 7% of global revenue.

Korea AI Basic Act — Effective January 2026. Accountability frameworks for AI systems. \$7.27B government AI budget.

The Opportunity — AI Agent Economy: \$7.84B (2025) → \$52.62B (2030), 40%+ CAGR Audit Trail Automation: \$650M (2024) → \$3.2B (2028), 38% CAGR

AI Compliance Settlement Layer

NOT

- An AI marketplace
- A cloud platform or model host
- An agent framework
- An output quality judge

IS

The financial and compliance rail for AI execution

Baram does not guarantee AI is correct. It guarantees who is economically responsible when AI is not.

Auditable. Accountable. Governed.

Every AI execution →

- Immutable on-chain receipt (AER)
- Budget enforced by smart contract, not trust
- Instant kill switch — one transaction to freeze agent
- Settlement and audit record inseparable by design

Settlement & Audit Trail

- Human principal defines agent rules on-chain
- AER minted after every inference — immutable, portable
- Move linear types make settlement without AER impossible

AIExecutionReport — The On-Chain Receipt

WHO (Requester)

Initiator, authorizer, delegation chain
(up to 5 levels)

WHO (Executor)

Provider identity, verified against
transaction sender

HOW MUCH

Payment, fees, budget used, remaining
balance

WHAT / WHY / CHAIN

Model, input/output hashes, purpose,
tier, timestamps, decision chain

Seven On-Chain Constraint Layers

Budget Delegation: Human creates Budget, deposits NUSDC, assigns to AI agent
— 7 atomic constraints enforced

Layers: Agent Identity • Active Status • Expiry • Balance • Per-Request Cap •
Allowlist • Rate Limiting

7 Layers

Atomic constraint enforcement,
no workaround path

Kill Switch

1 transaction to halt all agent
spending, instant absolute control

Executor Trust Infrastructure

Compute providers register on-chain with supported models, endpoints, and optional privacy capabilities.

They stake NSN tokens as economic collateral, accumulate reputation through successful job completion, and are organized into tiers reflecting both financial commitment and track record.

Job assignment uses reputation-weighted selection, creating a competitive marketplace where reliability is structurally rewarded.

Non-custodial participants with explicit machine-readable rules

BARAM. NASUN.IO

TEE Privacy – The Executor Cannot Read Your Prompt

AWS Nitro Enclave

Hardware-isolated zone. No network access. Key destroyed at shutdown.

RSA-OAEP Encryption

Prompt encrypted before entering enclave. Even AWS infra cannot access content.

On-chain Attestation

PCR baselines registered on-chain. Code modification halts settlement.

TEE is optional. Organizations choose privacy level based on data sensitivity and compliance requirements.

From Request to Receipt — One Atomic Transaction

- **Register:** Create AgentProfile, link owner to agent address (one-time)
- **Fund:** Create Budget with 7 constraints, deposit NUSDC into escrow
- **Request:** All 7 constraints checked → NUSDC locked in escrow
- **Settle:** NUSDC released → AER minted → Reputation +10 → Tier recalculated (single PTB)
- **Audit:** AER in wallet. Permanent, portable, verifiable. All steps succeed or all fail.

Built, Not Promised — Live on Nasun Devnet

Contracts

5 packages deployed:
Escrow, Budget, Executor,
Attestation, AER, Compliance

AER + Budget

31-field AER • 7-layer budget •
4-tier executor • TEE pipeline
verified

SDK + Tests

@nasun/baram-aer-sdk • E2E
tests 9/9 • \$0 external funding

Competitive Position – The Empty Market

AI Infra (Bittensor, Akash, io.net)

- Compete on compute cost and GPU availability
- No on-chain audit trail or budget enforcement
- Not designed for regulated environments

AI Observability (LangSmith, W&B) + Cloud (AWS, Azure)

- Track performance metrics, controlled by platform operator
- Insufficient for auditors, not tamper-proof, not on-chain
- **Baram:** 31-field AER • NUSDC escrow • 7-layer budget • TEE + attestation

The Team

Naru – Founder, Protocol Lead

- Built Nasun L1, Pado, Baram
- Film producer/editor with premieres at Cannes, Berlin, Venice
- First author of a peer-reviewed SCIE journal article in mental health
- Crypto builder since 2022

Overclocked – Founder, Ecosystem Lead

- Built SPECTRA (UE5 C++)
- Media production for Microsoft, Nike, IBM
- Author of the Gen Sol universe
- Crypto investor/builder since 2017

2 founders • \$0 funding • Shipped L1 + DeFi + AI compliance layer • 10 Korean government grants.

BARAM. NASUN.IO

Roadmap

Phase 1 – Prove (2026) Public testnet • Developer beta • SDK framework integrations • 10K AER target • Executor staking, General + TEE inference

Phase 2 – Scale (2027) Mainnet • Permissionless executor entry • Compliance dashboard • Model licensing & royalty distribution • Multi-provider consensus

Phase 3 – Standard (2028+) ZK proofs • Multi-chain verification • Enterprise batch processing • Regulatory standard adoption • ModelObject DeFi composability

Revenue & Go-to-Market

Transaction-Based. Per-inference fee.

Executor staking locks NSN • 10,000 agents = 3M TX/day at scale

GTM: Developer Beta → SDK Integration → Enterprise Inbound → Executor Growth

Regulatory deadlines do the sales work. Korea AI Basic Act (Jan 2026) + EU AI Act (Aug 2026).

2026 target: 10,000 AER records by independent developers.

Your agent works for you. **Baram proves it.**

5 contract packages deployed · 31-field AER · \$0 funding

We are not asking you to fund an idea. We are asking you to scale something already running.
