

NASUN

Korea's Native Layer for Finance, IP, and Intelligence

✓ Devnet Live | ✓ DeFi | ✓ AI | ✓ Multiplayer Game | ✓ 10+ Gov Grants

nasun.io

THE PROBLEM

Capital, ownership, and decision-making power are increasingly concentrated within closed platforms and centralized intermediaries.

As finance digitizes, culture moves online, and AI systems gain agency, infrastructure determines who captures value and who gets to participate.

Today's digital economy lacks mechanisms for:

- **Transparent ownership**
- **Open participation**
- **Verifiable accountability**

THE OPPORTUNITY

Technology now makes a different structure possible.

Blockchains, programmable ownership, and verifiable AI systems enable new models of production, distribution, and coordination, where participation and value creation are aligned rather than opposed.

Three domains are converging around this possibility:

Decentralized Finance

Digital IP Ownership

AI Governance

Together, they require shared economic infrastructure to function. That infrastructure does not yet exist.

Existing networks can support these domains individually. They were not designed to evolve around them.

THE VISION

Nasun builds an infrastructure layer designed to expand participation rather than concentrate control.

We begin in South Korea, the first market where all three conditions converge:

Financial demand

High crypto adoption creates demand for self-custodial financial autonomy beyond centralized exchanges.

Cultural transformation

Globally influential Korean creators and communities are building digital identities and audiences without programmable ownership.

Regulatory activation

Rising national AI investment and incoming regulation create urgency for verifiable governance of AI systems.

Korea is where the thesis becomes real. The window is now.

WHY NOW

Between 2025–2027, three structural shifts converge:

Capital Migration

Korean crypto liquidity is moving offshore due to limited compliant domestic infrastructure.

Ownership Transition

Entertainment IP is evolving into persistent digital economies rather than one-time media consumption.

Regulatory Activation

AI deployment is shifting from experimentation to regulated operation under:

- Korea's AI Basic Act (2026)
- EU AI Act (2026)

Each shift creates opportunity independently.

Together, they create a narrow window for a vertically integrated network to become default infrastructure before incumbents adapt.

Nasun's core bet:

Korea becomes the first jurisdiction where regulated crypto markets, entertainment economies, and AI governance converge on-chain.

PADO

A global DeFi platform with live architecture, entering Korea through a regulation-aligned launch.

Global platform: Spot and perpetual trading, unified margin and lending, advanced market primitives.

Korea 2026: Non-custodial spot trading, on-chain price discovery, KRW access pathways, and Korean-localized UX.

Role: Liquidity acquisition and wallet distribution.

Financial Liquidity Engine

Working alpha on devnet

Domestic exchanges remain custodial and opaque. No venue offers compliant self-custody or transparent on-chain markets. Pado enters that gap through spot trading, establishing trust and infrastructure before regulatory expansion, becoming Korea's default DeFi venue within a globally liquid network.

GEN SOL

Transmedia sci-fi IP introducing Web3 ownership gradually:

Live multi-player alpha on AWS Gamelift + Web3

- UE5 multiplayer shooter (SPECTRA)
- Animated narrative universe
- Cross-media expansion
- Optional on-chain ownership

Role: Convert wallets into mainstream users.

Gen Sol is a cinematic universe, not a game with a token attached.

The IP leads; Web3 appears only where it improves player experience.

Games, animation, and film draw from a shared narrative centered on Spectra — a scarce energy resource driving conflict across the Gen Sol galaxy.

BARAM

- **Tamper-proof audit trails**
- **Seven-layer constraint enforcement**
- **AI Execution Reports (AERs)**
- **Executor staking marketplace**

Role: Enterprise demand and long-duration staking.

Baram provides verifiable enforcement and auditability aligned with:

Korea's AI Basic Act (Jan 2026)

EU AI Act (Aug 2026)

On-Chain AI Governance Infrastructure

Live AI agent dashboard and chat with audit trails and privacy.

When organizations grant AI agents access to tools, APIs, or capital, they must prove every action was authorized and compliant.

PRODUCT SEQUENCING

Nasun scales markets sequentially, not simultaneously.

Phase 1 — Liquidity (Pado)

Launch global DeFi markets while onboarding Korean users through regulation-aligned spot trading and self-custody infrastructure.

Phase 2 — Adoption (Gen Sol)

Convert wallets into cultural participants.

Phase 3 — Institutionalization (Baram)

Capture regulated enterprise demand and long-duration staking.

Each phase increases switching costs and strengthens the next.

WHAT ALREADY EXISTS

Nasun is pre-traction, not pre-product.

Built prior to fundraising:

Nasun L1:

Move-based chain, validators,
governance, zkLogin wallet,
explorer — live on devnet

Pado:

Unified DeFi platform operational

SPECTRA:

Multiplayer UE5 shooter running on
AWS GameLift — playable,
animation series in development

Baram:

Functional constraint enforcement
+ AER pipeline

The full stack exists before institutional capital.

INDEPENDENT VALIDATION

Between 2023–2025, Nasun received 10 competitive South Korean government grants from:

- Ministry of Culture, Sports and Tourism
- KOCCA
- NIPA
- Busan Metropolitan City

Nasun was the only Web3 project repeatedly selected across evaluation cycles competing against established studios and technology firms.

Evaluation bodies are structurally incentivized to reject speculative crypto proposals

THE ECONOMIC FLYWHEEL

Nasun's products operate as one reinforcing system:

Pado → creates global liquidity and onboard Korean users for self-custody trading

Gen Sol → converts liquidity into cultural participation

Baram → introduces enterprise staking demand

All activity routes through:

- one wallet
- one identity layer
- one token (NSN)
- one validator economy

User reputation and asset history become non-portable, increasing retention across verticals.

WHY A DEDICATED LAYER-1

Nasun's products require guarantees that cannot exist above settlement.

Pado: Conditional orders like stop-loss, take-profit, and trailing stops execute atomically at the validator level, not through off-chain keeper bots.

Baram: Compliance proofs are inseparable from execution. Hardware attestation and budget enforcement happen before transactions clear, not verified after the fact.

On someone else's chain, these become feature requests. On ours, they become releases.
General-purpose chains optimize for neutrality. Nasun optimizes for regulated economic coordination.

ONE CHAIN, ONE GROWTH CURVE

On external chains, application growth and network value diverge. Fees, liquidity, and incentives flow outward.

On Nasun, application growth is network growth. Pado trading, Gen Sol asset economies, and Baram executor staking all compound through NSN and the validator economy.

Owning settlement converts usage into permanent economic gravity.

MARKET SIZE

Korea's crypto market is structurally large and structurally underserved.

~\$110B in Korean crypto capital traded offshore in 2025.

Corporate crypto trading legalizes in 2026.

The Korean government has allocated \$7.27B to AI infrastructure.

Korea consistently ranks among the highest retail crypto participation markets globally.

The capital is there. The compliant domestic infrastructure is not.

Initial wedge: Korean on-chain spot trading, expanding into full DeFi participation as regulation evolves.

Revenue model: 5,000 active wallets · \$150M monthly volume · 5 bps capture → **\$0.9M annualized** 0.5% of offshore flow captured → **\$27M annualized**

THE TOKEN (NSN)

NSN functions as the unified economic routing layer:

- Gas & validator staking
- Trading collateral
- Game asset minting
- Tournament participation
- AI executor staking
- Governance

Value sinks:

- Trading settlement, fees, and collateral demand (Pado)
- Staking lockups (Baram)
- Digital asset issuance (Gen Sol)

Total Supply: 10B

Circulating at TGE: 8–11%

Unlocks tied to verified ecosystem milestones rather than time.

No dividends. No guaranteed yields.

COMPETITIVE POSITION

Nasun's differentiation is structural, not incremental.

Category	Competitors	Structural Limitation
Korean Networks	Kaia, WEMIX	Infrastructures designed for single markets
Global DeFi	Hyperliquid, dYdX	Cannot localize regulatory stack deeply
AI Compute	Akash, io.net	Optimize compute supply, not compliance enforcement
General L1s	Ethereum, Solana	Governance neutrality prevents vertical optimization

Nasun is purpose-built for deep integration with community owned projects & applications.

THE RAISE

Pre-Seed: \$1.5M

Four hires unlock sequential phases:

Protocol Security Engineer

→ coordinate testnet operations

DeFi / Smart Contract Engineer

→ open alpha

Game Infrastructure Engineer

→ scalable deployment for SPECTRA

AI / Compliance Systems Engineer

→ enterprise deployment of Baram

Funds also support audits, validator decentralization, regulatory preparation, and testnet launch. Runway extends to measurable ecosystem milestones.

FOUNDERS

Naru — Founder & Protocol Lead

- Built Nasun L1, Pado, Baram
- Film producer/editor with premieres at Cannes, Berlin, Venice
- First author of a peer-reviewed SCIE journal article in mental health
- Crypto builder since 2022

Overclocked — Founder & Ecosystem Lead

- Built SPECTRA (UE5 C++)
- Director & writer of theatrically released films
- Media production for Microsoft, Nike, IBM
- Author of the Gen Sol universe
- Crypto investor/builder since 2017

Networks: Korean government agencies, crypto infrastructure, gaming studios, and entertainment industry

WHY THIS WINS

Most crypto projects build infrastructure first and search for applications later.

Nasun built applications first, discovered economic alignments, and then built the network they required.

The convergence window is opening:

- **Launch the first native DeFi platform.**
- **Ownership and participation in entertainment economies** is untapped
- AI compliance now has fixed regulatory deadlines

Nasun positions itself as the settlement layer where these forces meet.

We are not raising to begin building.

We are raising to establish default infrastructure before incumbents adapt.
